

Introduction to Skin Types

Oily Skin

- Characteristics: Excess oil production, shine, larger pores.

Recommended Cleansers:

- o Foaming Cleansers: These can help remove excess oil without drying out the skin.
- o Gel Cleansers: Non-greasy and help with oil control.
- o Salicylic Acid Cleansers: Great for acne-prone skin as it penetrates pores to clear out excess oil and prevent breakouts.

Combination Skin

Characteristics: Oily in some areas (usually T-zone) and dry in others (usually cheeks).

- Recommended Cleansers:
 - o Gel-Based Cleansers: These work well for combination skin, balancing both oily and dry areas.
 - o Micellar Water: Gentle and effective for removing impurities without over-drying.
 - o Balanced Foam Cleansers: A mild foam cleanser that isn't too drying but still removes excess oil.

Comedones (blackheads) are areas of sebum and dead skin cells which are found in the hair follicle. They turn black when exposed to oxygen in the air.

Dry Skin

- Characteristics: Tightness, flakiness, thin/course texture, dullness. Often can be sensitive and shows signs of premature ageing (lines and wrinkles)
- Lacking is moisture or sebum or both
- Pores are small and tight

Recommended Cleansers:

- o Cream or Milk Cleansers: These are gentle and hydrating, helping to remove dirt without stripping natural moisture.
- o Hydrating Cleansers: Formulated to add moisture while cleansing.
- o Oil-based Cleansers: These can effectively cleanse while maintaining hydration, as oils help to replenish the skin.

Sensitive Skin

Characteristics: Redness, irritation, burning, or itching from some products

- Recommended Cleansers:
 - o Non-foaming, Fragrance-Free Cleansers: Opt for calming formulas without fragrances or harsh ingredients.
 - o Micellar Water: Gentle and effective, it cleanses without irritating sensitive skin.
 - o Gel or Cream Cleansers: Choose soothing, mild formulations with natural ingredients like aloe or chamomile.

Photo ageing

- Premature skin ageing caused by exposure to the sun and UV radiation including tanning beds.
- This typically causes wrinkles, reduced elasticity, pigmentation and uneven skin texture

Rosacea

- In early stages they experience frequent flushing and blushing
- Rosacea can develop across 4 stages (1 – 4) often known as pre rosacea, mild, moderate and severe.
- In more developed stages it can present as persistent redness, telangiectasia and burning or itching.
- This is often triggered by heat, hormones, weather, stress, exercise and certain spicy foods.

Stage 1 example
Erythematotelangiectatic

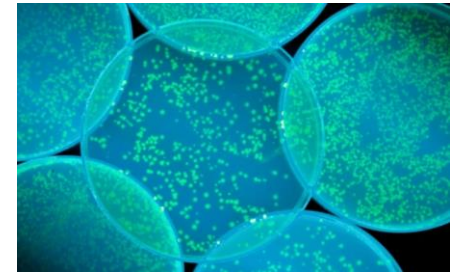

Pigmentation

- Pigmentation affects the colouring of the skin and is caused by melanin. It is caused mainly by sun exposure, genetics, hormonal changes, inflammation and certain medications or medical conditions.
- Hyperpigmentation (increased)
- Hypopigmentation (decreased)
- Melasma – a skin disorder that presents often as blotchy, brownish, bilateral pigmentation

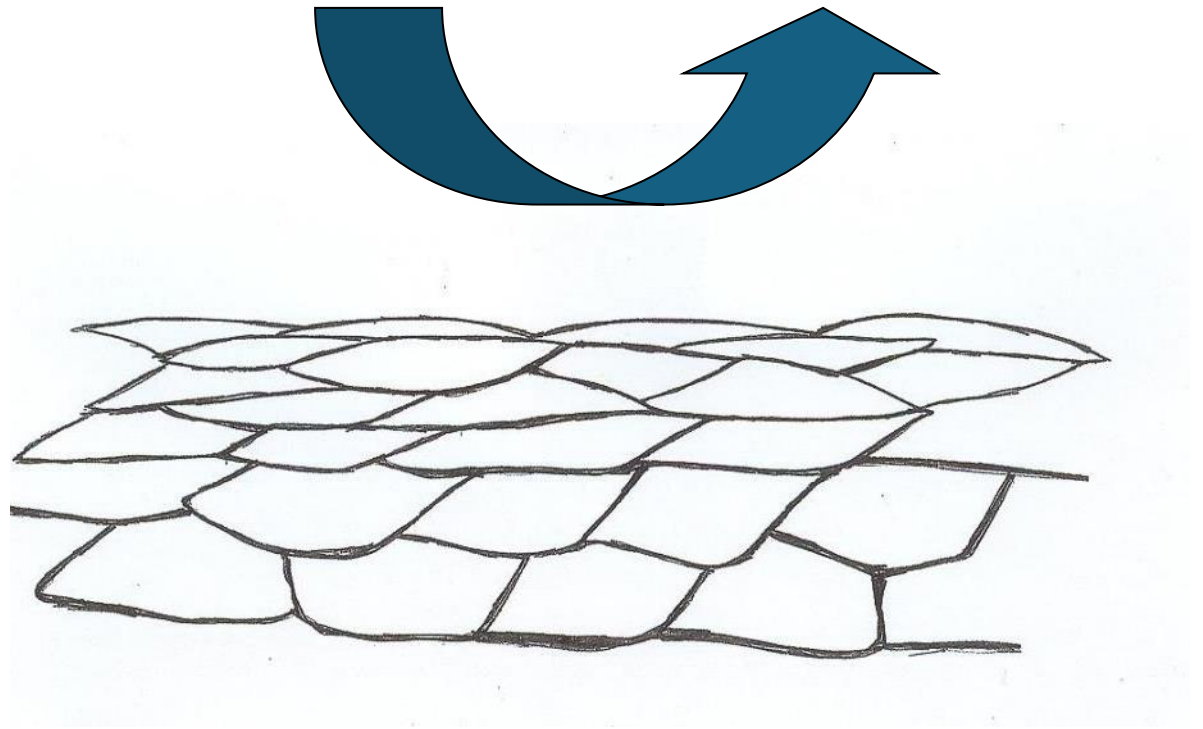

Causes of Skin Conditions

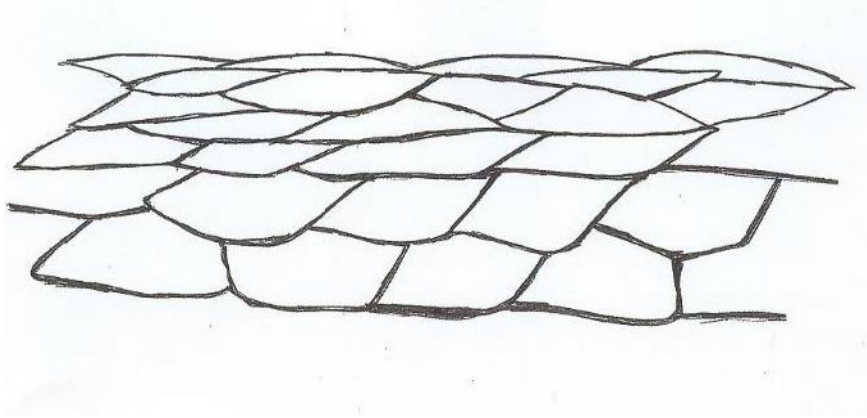

- Sun Exposure – ageing, melanoma, pigmentation
- Intrinsic Factors – genetics, hormones, diet/gut issues, exercise, lifestyle, stress
- Extrinsic Factors – pollution, smoking, radiation, free radicals
- Poor (or lack of) skincare routine

A healthy external skin barrier
protects against environmental
attack

External Skin Barrier

It's the Roof of the skin:

External skin barrier is the top 12 to 15 skin cells

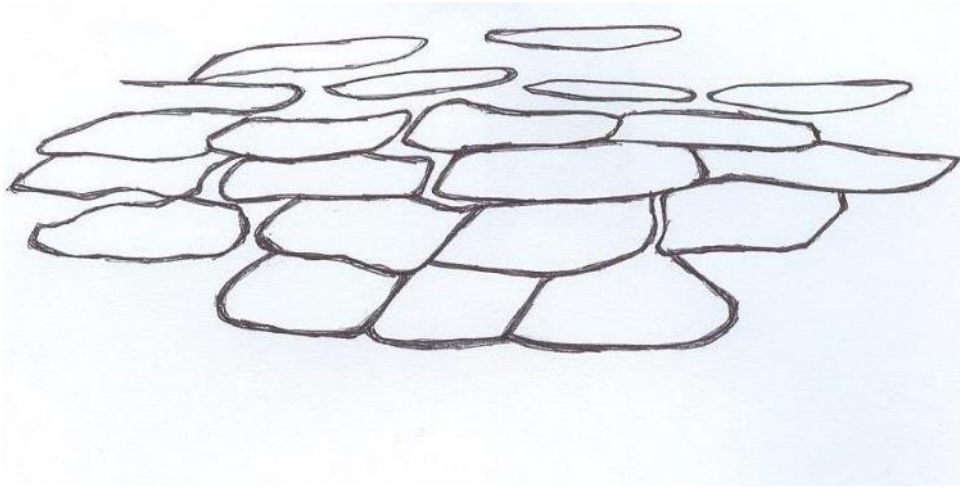

Flattened skin cells and lipid layer

Provides protection to the deeper skin layers

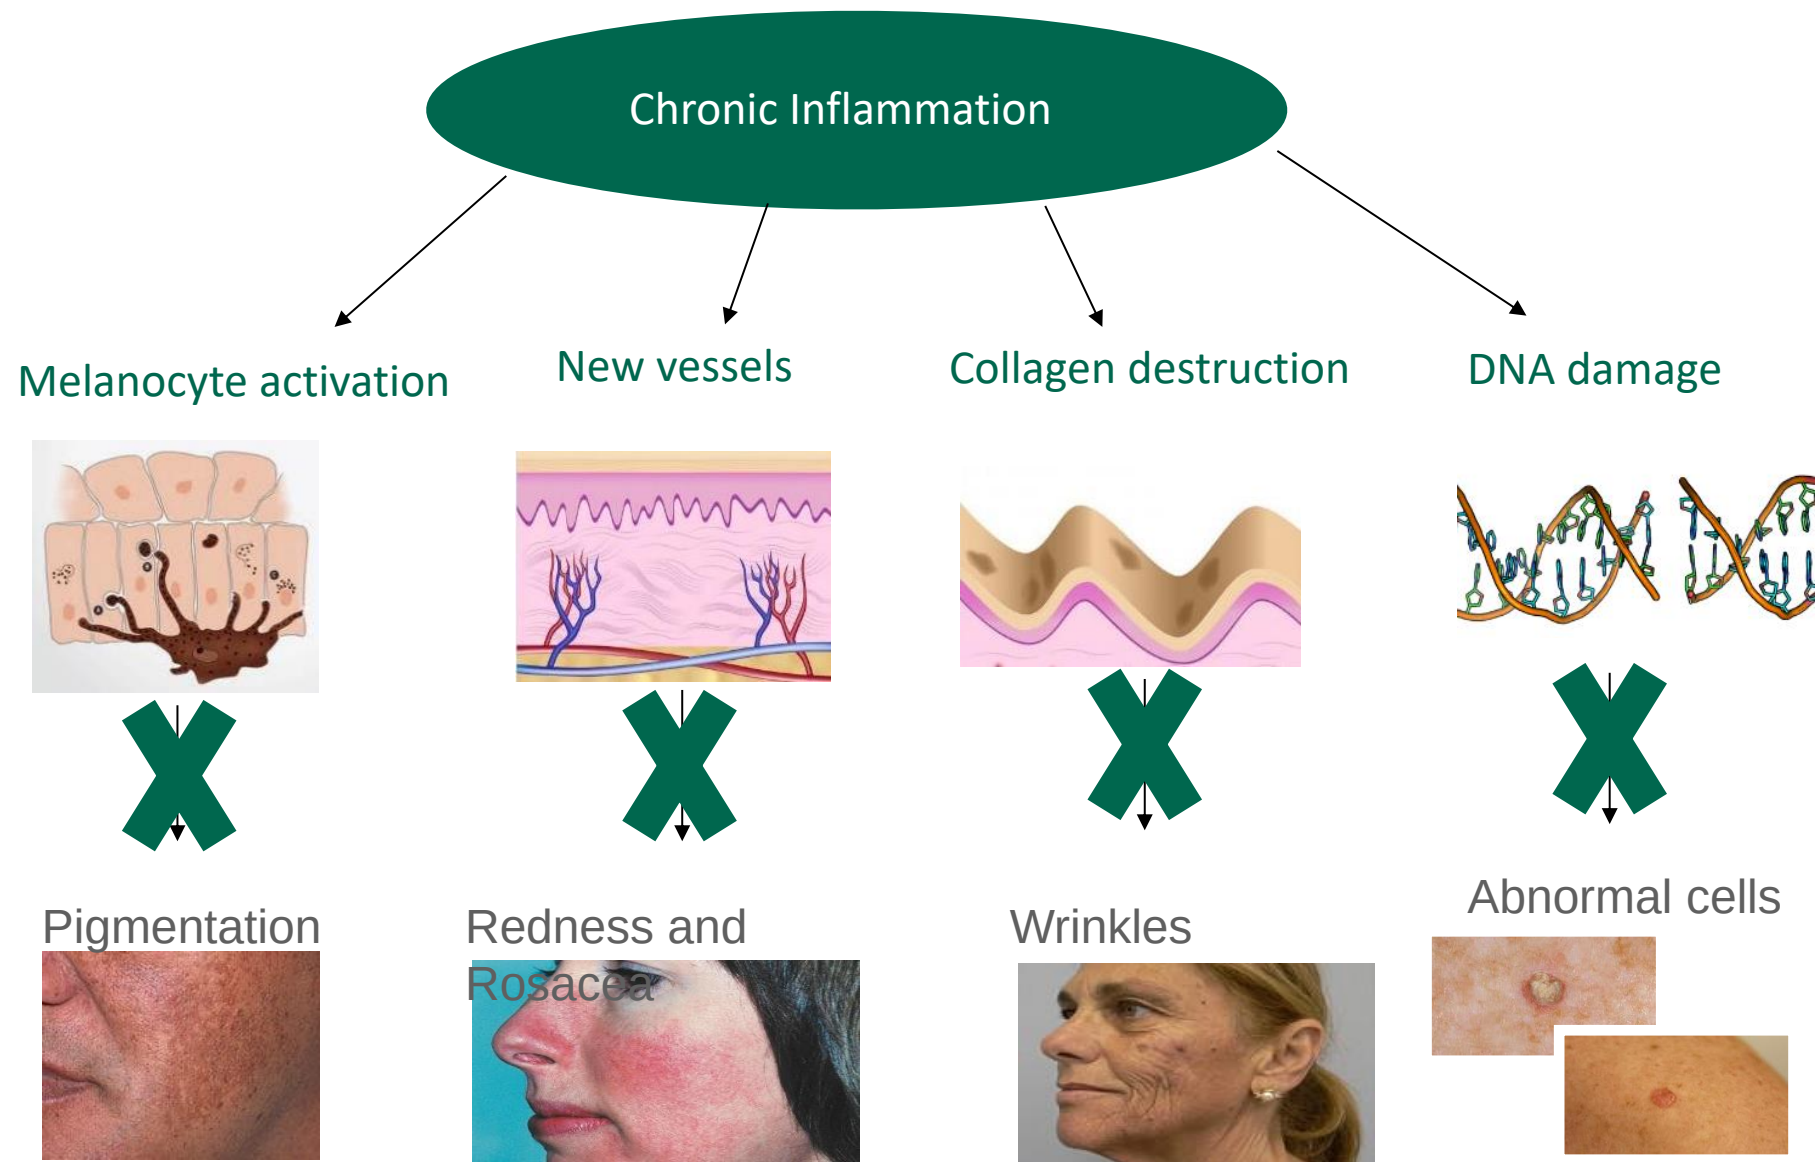

Cells lift off naturally and replace themselves

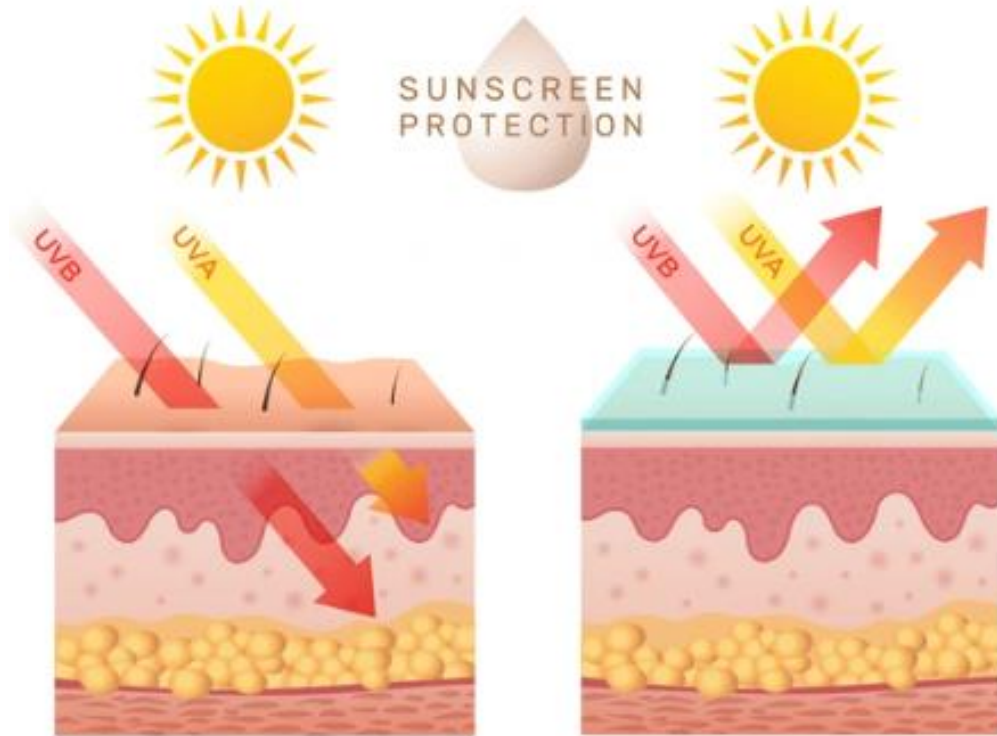

Damaged External Skin Barrier

External skin barrier deteriorates due in part to altered lipids between the cells. Cells separate and micro channels appear allowing external factors to penetrate more easily. As more unwanted product penetrates you could become sensitive or reactive to products that you weren't previously.

The Importance of SPF

UV radiation damages our skin cells causing premature ageing and an increased risk of skin cancer

Many skin conditions are caused by UV damage which could be prevented by daily SPF and reducing exposure levels
