

Understanding Facial Treatments

Benefits of Facial Treatment

- Improve skin concerns
- Improve circulation
- Improve lymphatic drainage
- Relaxation

Why is Skincare important?

- Improves skin conditions
- Supports the health of the skin
- Improves patient's self esteem
- Revenue potential
- Patient retention
- Enhances results of other aesthetic treatments

Introduction to a Skincare Routine

- First Cleanse (superficial) remove make up, pollutants, bacteria, products etc from the skin surface. It can be performed twice if required
- Double cleanse (Deep) ensure everything has been removed or use the second cleanse to target a specific skin concern)
- Tone – rebalance the skin's PH
- Targeted products (ie serum, eye, neck cream etc)
- Moisturiser
- SPF

10 Steps to a Facial Routine

SPF

Equipment List

- ❖ Trolley
- ❖ Couch
- ❖ Couch roll
- ❖ Gauze
- ❖ Cotton pads
- ❖ Steamer + distilled water
- ❖ Gloves
- ❖ Mitts (damp)
- ❖ Towels
- ❖ Products
- ❖ Mag lamp
- ❖ Hot towel warmer
- ❖ Camera/CRM system for consultation, consent and medical history

Hygiene, Hazard & Risk Considerations

- Set up within a hygienic field. Wiping over equipment, bed, and equipment with a suitable sterilisation wipes.
- Use appropriate PPE Use single items as appropriate such as disposable gloves (latex free) protective face mask. Additional single use – head bands, gauze, wipes, spatula, couch roll.
- Sharpen pencils in-between use.
- Standard infection control precautions (SICPs) General hygiene such as hand washing and alcohol-free hand sanitation gel.
- Replace lids on containers.
- Waste disposal – general and contaminated in accordance with local authority requirements
- Knowledge of infection prevention and control, bacteria, fungi, parasites, prevention of cross contamination and disease transmission procedures, level of infection control.
- Risk assessments to be carried out
- Putting or following procedures to minimise risk.
- Ensure all staff have full training and are following company protocols and policies.
- Give patients verbal and written pre and post care
- What are the implications or not following safety checks
- Audits on quality and preventative maintenance.
- Understanding when not to treat and when to refer to another professional (stay within your remit)

Consultation

- Reason for treatment
- Discuss skin concerns, lifestyle and wellbeing
- Contraindications and limitations of treatment
- Suitability of treatment
- Benefits
- Skin analysis
- Aftercare
- Cost and treatment plan

Use tools such as a mirror and information leaflets to ensure the patient fully understands the treatment. Document the consultation with notes and photographs

Contraindications and Precautions

- Active skin infections (herpes, impetigo, ringworm etc)
- Eczema, psoriasis, dermatitis (at treatment area)
- Recent surgery
- Allergies
- Pregnancy (avoid active ingredients such as retinols)
- Uncontrolled diabetes
- Skin lesions
- Pacemaker or heart condition
- Mental pins or implants (avoid for electrical treatments)
- Wait 2 weeks between any injectable or skin treatments
- Cold, flu or antibiotics (wait until recovered)
- Claustrophobia (skin warming)

Introduction to Facial Touch

- Make sure you have everything prepared
- Ensure the patient is comfortable (warmth, dignity, support)
- Ensure you are comfortable to begin treatment (maintain good posture)
- Maintain constant touch when you are applying products or performing the cleansing routine

Cleansers

- Different skin types require different cleansing products. It is common for an individual to have two different cleansers within their skincare routine for optimum results

The main types of cleansers are:

- Milk/lotion
- Cream/balm
- Oil
- Foam
- Gel
- Know your skin's pH: A balanced cleanser will have a pH of around 5.5. This ensures it doesn't disrupt the skin's natural barrier.
- Look for active ingredients: depending on your skin's needs (e.g., salicylic acid for acne, hyaluronic acid for dryness), choose products with ingredients that target specific concerns.

Eye and Lip Cleanse

- Apply 2 drops of eye make up remover to 3 cotton pads
 - Cover each eye with a cotton pad applying light pressure
 - Use the 3rd cotton pad to wipe across the lips
-
- Supporting the brow with one hand gently wipe the eye area with the cotton pad until make up is removed and area is clean
 - Repeat on the other eye

Performing a Skin Cleanse

- Place the product into the hands (approx. 2 pumps)
- Evenly apply the product from the base of the neck
- Using circulation movements with your fingers work the product into the skin focusing on areas of congestion such as the T zone
- Keep simultaneous movement for relaxation

Performing a Skin Analysis

A thorough assessment is vital for understanding the skin and being able to determine which treatments and products are most appropriate for the patient

- Cover the eyes with a damp cotton pad to protect them from the mag lamp light.
- Visual examination
- Tactile examination

Use a look and touch method starting on one side and moving to the other.

Deep Cleanse

- Select cleansing product to suit patient's skin type
1. Stroke upwards either side of the neck and then apply circular movements
 2. Glide the index fingers across from the chin to the jawline
 3. Apply circular motions from the chin, nose and temple
 4. Following the width of the forehead lines perform a sliding criss-cross movement with the index and middle finger
 5. With the ring finger trace a circle around the orbital bone. Lift from the inner brow using the index finger
 6. Repeat each movement 3 times
 7. Finish with a gentle press at the temples

Product Removal

Warm mitt – open palms and introduce at side of face

Press both cheeks

With alternate hands press the forehead and lower face

Starting from the neck remove the product in an upwards and outwards direction towards the hairline using a simultaneous stroking motion.

Flip and turn the mitt half way through so both sides are used

Toning

After cleansing add a couple of drops of toner onto 2 cotton pads.
Touch at the temples and wipe the cotton pads upwards from the neck ensuring all areas are covered

Benefits of toning

- Removes any remaining traces of cleanser/products
- Balances the skin's PH
- Hydrate or calm the skin
- Prepare the skin for the next stage of the routine
- Minimise pores

Avoid the eyes or any broken/sensitive areas of skin. The toner should be appropriately selected for the skin type

Manual Exfoliation

After toning add a pea sized amount of exfoliator onto the tips of your fingers. Add a drop of water to mix

Apply this evenly across the face and gently work into the skin focusing on the T zone or areas of concern

Remove with a warm mitt or cleansing cloth

- Congestion
- Removes dead skin cells
- Be careful on sensitive areas and avoid broken skin

Chemical Exfoliation

After cleansing add a pea sized amount of exfoliator onto the palm of your hands

Apply this evenly across the face as a thin layer

Leave for a few minutes and remove with a warm mitt/cleansing cloth

- Congestion/blocked pores
- Removes dead skin cells
- Be careful on sensitive areas and avoid broken skin

Steam/Heat

- Hydration
- Opens pores
- Softens and prepares skin for extraction
- Not suitable for those with inflamed skin

Direct the steam from a safe distance away from the face. Keep even distribution and movement

- Encourage patient to breath out through their mouth
- Steam for up to 5 minutes

Extraction

- After the skin has been cleansed and warmed you can look to remove minor blemishes and comedones (blackheads)
- Disinfect the skin prior to removal
- For comedone removal use the loop end of the extractor tool and apply gentle pressure around the comedone to lift it. Wipe away with damp pad
- For manual extraction too wrap a tissue or cotton pad around your index fingers, apply gentle pressure at the sides of the comedone to remove it.

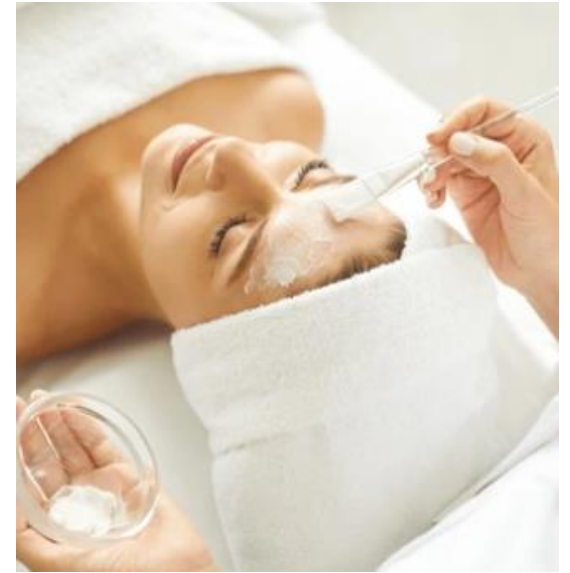

Extraction Precautions

- Ensure area is kept clean and where possible comedone is extracted to reduce risk of infection
- Too much pressure could lead to skin bruising
- Capillary damage can occur if too much pressure is applied
- If blood occurs this must be cleansed and pressure held to area
- Do not attempt to remove larger blemishes or cysts
- If a comedone does not lift after a couple of attempts do not persist and cause harm

Mask Application

- Masks can take different forms either as a sheet (a piece which is applied to the skin) or as a product using a brush. They will vary depending on skin concern, application and removal.
- Peel off mask
- Sheet mask
- Clay/product mask

Applying Serums

- Apply a couple of drops of serum to your finger tips
- Press the product evenly into the skin and gently massage in until absorbed

Applying Eye Products

- Apply a rice size amount to the tip of each ring finger
- Applying dots anti clockwise (outwards inwards) around the orbital bone
- Lightly apply this into the skin following the circle of the orbital bone
- Finish with a figure of 8 at the crows feet

Applying Moisturisers

- Apply the products in small dots evenly to the neck and face.
- Spread this evenly from the from the neck using upwards and outwards stroking movements.
- If the moisturizer does not have an incorporated SPF this should be applied at the end following the same application technique

Aftercare

- Avoid make up for 24 hours
- Avoid harsh or active ingredients for 48 hours
- Avoid strenuous exercise and heat treatments for 48 hours
- Avoid other skin or injectable treatments for 2 weeks
- Drink lots of water
- Avoid sun exposure and wear daily SPF

Introduction to Facial Massage Movements

Effleurage

- Stroking movement to introduce
- Speed and pressure can be altered

Benefits

- Desquamation
- Increased blood circulation (removal of congestion and bringing fresh nutrients)
- Lymphatic
- Muscle relaxation

Petrissage

- Lifting and compression
- Intermittent pressure

Benefits

- Improve muscle tone
 - Increased blood and lymph circulation
 - Increase of sebaceous gland activity
-
- *Kneading, knuckling, pinching, rolling, scissoring*

Percussion

- Also called Tapotement
- Fast stimulating rhythm

Benefits

- Fast vascular reaction
- Erythema and increased blood supply
- Improvement in muscle and skin tone
- *Light clapping, tapping*

Frictions

- Cause the skin and superficial structures to move together
- Regulated pressure

Benefits

- Desquamation
- Stimulation improvement of superficial tissues
- Improvement in blood and lymph circulation
- Improvement in scar tissue
- Break down tight nodules/tension
- *Scissor*

Vibrations

- Applied on the nerve centre
- Rapid contraction and relaxation of therapist's arms creating trembling movement

Benefits

- Stimulation of nerves and skin
