

Understanding States of Matter

Natural and Physical Science

The study of all living organisms and inanimate natural objects

Natural = study of organisms (biology, ecology, zoology etc)

Physical = 'non living' (physics, chemistry, astrology etc)

Matter

A physical substance that takes up space and can be weighed

It has volume and mass

Matter Example

Examples in this image

Glasses

Clothes

Mug

Watch

Ring

and the man himself!)

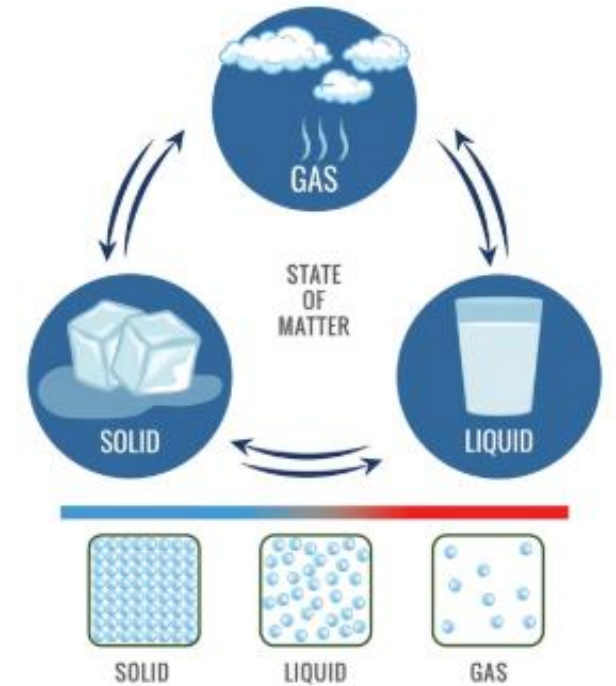

States of Matter

Solid tightly packed particles with mass (ie brick, ice)

Liquid loosely packed moveable particles (ie milk, water)

Gas moves freely only enclosed in a container (ie oxygen)

Periodic Table

- The periodic table is a foundational tool in chemistry that categorises elements based on

Atomic number

Electron configuration

Shared chemical properties

Understanding the periodic table allows us to predict how elements behave in reactions, their physical properties and their interactions with other elements
